                                                                                                                                       The present sequence is the protein sequence for IP131 D20K. The sequence is based on the human interleukin-2 (IL-2) peptide IP130 (See ABM84292) by the addition of a C-terminal Tyr residue, and substitution of the native Asp-20 residue by Lys. Asp-20 is located in a region of IL-2 that directly influences interaction of the cytokine with its receptor (IL-2R). An antibody that binds to the peptide is claimed, and is preferably an antibody produced by hybridoma H2-8 (CNCM No. I-238). A claimed method of detecting the presence or activity of involves contacting a sample with the peptide. A claimed method for inducing IL-2R activity in a patient comprises administering IP131 D20K to the patient. A vector containing DNA encoding the peptide is claimed, and is used in a claimed method for treating a patient deficient in IL-2 activity. Also claimed method for treating a patient deficient in IL-2 activity. Also claimed method for treating a patient deficient in IL-2 activity. Comprises administering method acid substitutions, i.e. change of non-polar R-groups by other uncharged polar R-groups by other uncharged polar R-groups by Lys, Asp by Glu, Thr by Ser, or Asn by Glu, and vice versa. The peptide induces SHC phosphorylation or induction of the SHC/MARK pathway. Antibodies specific for the formal or and the section of the se
                                                New peptides derived from Interleukin 2 designated IP130 and IP131 are useful as therapeutic agents in the treatment of patients deficient in LL-2 activity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immune reactions such as graft rejection, or autoimmune disorders such as rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The present sequence is not shown in the specification but
is derived from the IL131 sequence given in page 2 (see ABB79534)
by removal of the N-terminal Met residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IP131; interleukin-2; human; gene; gene therapy; mutant; mutein.

The present sequence is the protein sequence for IP131 D20K. The sequence is based on the human interleukin-2 (IL-2) peptide IP130 (see ABN8422) by the addition of a C-terminal Tyr residue, and substitution of the native Asp-20 residue by Lys. Asp-20 is located in a region of IL-2 that directly influences interaction of the cytokine with its receptor (IL-2R). An antibody that binds to the cytokine with its receptor (IL-2R). An antibody produced by hybridoma H2-8 (CNCM No. 1-2338). A claimed method of detecting the presence or activity of involves contacting a sample with IP131 D20K, and detecting whether binding occurs. A claimed method for inhibiting IL-2R activity involves contacting IL-2R with the peptide. A claimed method for inducing IL-2 activity in a patient containing DNA encoding the peptide is claimed, and is used in a claimed method for treating a patient deficient in IL-2 activity. Containing conservative amino acid substitutions, i.e. change of non-polar R-groups but other non-polar R-groups, containing conservative amino acid substitutions, i.e. change of non-polar R-groups by other uncharged polar R-groups by claimed are versa. The peptide induces SHC phosphorylation or induction of Arg by Lys, Asp by Glu, Thr by Ser, or Asn by Glu, and vice versa. The peptide induces SHC phosphorylation or peptide are useful for treatment or prevention of undesirable immune reactions such as graff rejection, or autoimmune disorders such as rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptides derived from Interleukin 2 designated IP130 and IP131 are useful as therapeutic agents in the treatment of patients deficient in LL-2 activity.
                                                                                                                                                                                                                                   Alzari P;

Amino acid sequence of human interleukin-2 (IL-2) mutein D20K.

Human; interleukin-2; IL-2; IL-2 mutein; HIV; cancer; renal carcinoma; malignant melanoma; autoimmune disease; infectious disease; immune deficiency; SCID; tuberculosis; adjuvant; cancer vaccine;

Lembach KJ, Wetzel GD;

Jesmok G,

```
AAY53822-66 represent human interleukin-2 (IL-2) muteins, where human IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type IL-2, when used in cancer treatment, has adverse side effects. The coxicities associated with IL-2 therapy include severe fever, nausea, vomiting, vascular leak and serious hypotension. The muteins described in this invention have reduced toxicity and are better tolerated. It is the mediation of IL-2 through natural killer cells which causes the citiacy is mediated by the direct activation of toxicity whereas the efficacy is mediated by the direct activation of cells. The muteins preferentially activate T cells which causes the colls. IL-2 muteins may be used for treating a mammal afflicted with an IL-2 treatable condition. The condition may be one of the following:

HIV, cancer including renal carcinoma and malignant melanoma, autoimmune disease, infectious disease, immune deficiency including SCID or other therapeutic application requiring general stimulation of the immune system. Other potential uses include treatment of infectious diseases is under an adjuvant in cancer vaccine strategy. The DNA sequences encoding the IL-2 mutein may be used in gene therapy applications in those diseases in which IL-2 is expected to provide an effective therapy due to its T cell activity. The sequence does not appear in the specification; it was created using information provided and the wild type IL-2 sequence (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; interleukin-2; IL-2; IL-2 mutein; HIV; cancer; renal carcinoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY53822-66 represent human interleukin-2 (IL-2) muteins, where human IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type IL-2, harn used in cancer treatment, has adverse side effects. The 'coxicities associated with IL-2 therapy include severe fever, nausea, toxicities invention have reduced toxicity and are better tolerated. It is the mediation of IL-2 through natural killer cells which causes the colls: The muteins preferentially activate T cells over natural killer cells. IL-2 muteins may be used for treating a mammal afflicted with an IL-2 treatable condition. The condition may be one of the following:

IL-2 treatable condition. The condition may be one of the following:

IL-2 treatable condition and malignant melanoma, autoimmune classase, infectious disease, immune deficiency including SCID or other therapeutic application requiring general stimulation of the immune classase, infectious disease, immune deficiency including strategy. The DNA sequences encoding the IL-2 mutein may be used in gene therapy complications in those diseases in which IL-2 is expected to provide an effective therapy due to its T cell activity.

Chaplications in those diseases in which IL-2 sequence (see notes the suppart in the specification; it was created in such an indicanation provided and the wild type IL-2 sequence (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

immune deficiency; SCID; tuberculosis; adjuvant; cancer vaccine;
                                                                                                                                                                                                                                                                                                                                                                                           terminal portion corresponding essentially to the AA sequence of interleukin-2 (IL-2) but contg. less than 100 AAs. The IL-2 sequence is coded for by 1,2 or 3 of the A-F segments of the IL-2 gene having the formula. (ECORI)-A-PStI-B-MUIT-C-XBal-D-SacI-E-Pvul-F-(SalI), for example, the sequence in AAN70921. The segments are joined in any appropriate sequence and opt. connected by usual adaptors or linkers.
                                                                                                                                                                                                                                                                        New fusion protein contg. small interleukin 2 ballast fragments - allowing control of product solubility, and corresp. genes, vectors and transformed host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "wild type Asp has been replaced with Ser"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY53822-66 represent human interleukin-2 (IL-2) muteins, where human IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type IL-2 in-2 when used in cancer treatment, has adverse side effects. The toxicities associated with IL-2 therapy include severe fever, nausea, vomiting, vascular leak and serious hypotension. The muteins described in this invention have reduced toxicity and are better tolerated. It is the mediation of IL-2 through natural killer cells which causes the toxicity whereas the efficacy is mediated by the direct activation of T cells. The muteins preferentially activate T cells which causes the toxicity whereas the efficacy is mediated by the direct activation of T cells. IL-2 muteins may be used for treating a mammal afflicted with an IL-2 treatable condition. The condition may be one of the following:

HIV, cancer including renal carcinome and malignant melanoma, autoimmune therapeutic application requiring general stimulation of the immune system. Other potential uses include treatment of infectious diseases to system. Other potential uses include treatment of infectious diseases to system. Other potential uses include treatment of infectious diseases to but sequences encoding the IL-2 mutein may be used in gene therapy applications in those diseases in which IL-2 is expected to provide an effective therapy due to its T cell activity.

The present sequence is a human interleukin-2 (IL-2) mutein, where human IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type IL-2, when used in cancer treatment, has adverse side effects. The toxicities associated with IL-2 therapy include severe fever, nausea, vomiting, vascular leak and serious hypotension. The muteins described in this invention have reduced toxicity and are better tolerated. It is the mediation of IL-2 through natural killer cells which causes the efficacy is mediated by the direct activation of T cells. The muteins preferentially activate T cells which causes the cells. IL-2 muteins may be used for treating a mammal afflicted with an IL-2 treatable condition. The condition may be one of the following:

HIV, cancer including renal carcinoma and malignant melanoma, autoimmune disease, infectious disease, immune deficiency including SCID or other therapeutic application requiring general stimulation of the immune system. Other potential uses include treatment of infectious diseases conclust and as an adjuvant in cancer vaccine strategy. The DNA sequences encoding the IL-2 mutein may be used in gene therapy applications in those diseases in which IL-2 is expected to provide an effective therapy due to its T cell activity.

Conce: this sequence does not appear in the specification; it was created custing information provided and the wild type IL-2 sequence (see
                                                                                                                                                 New polypeptide comprising a human interleukin-2 (IL-2) mutein useful for treating diseases such as HIV and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novoa Perez LI, Machado Lahera JA, Fernandez Maso JR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         disease, infectious disease, immune deficiency including SCID or other disease, infectious disease, immune deficiency including SCID or other system. Other potential uses include treatment of infectious diseases such as tuberculosis and as an adjuvant in cancer vaccine strategy. The DNA sequences encoding the IL-2 mutein may be used in gene therapy effective therapy due to its T cell activity.

The sequence does not appear in the specification; it was created using information provided and the wild type IL-2 sequence (see
                                                                                                                                                                                                           AAY53822-66 represent human interleukin-2 (IL-2) muteins, where human IL-2 has been substituted at one of positions 20, 88 or 126. Wild-type IL-2, when used in cancer treatment, has adverse side effects. The toxicities associated with IL-2 therapy include severe fever, nausea, vomiting, vascular leak and serious hypotension. The muteins described in this invention have reduced toxicity and are better tolerated. It is the mediation of IL-2 through natural Killer cells which causes the toxicity whereas the efficacy is mediated by the direct activation of reals. The muteins preferentially activated Tealls over natural Killer cells. IL-2 muteins may be used for treating a mammal affilicted with an IL-2 treatable condition. The condition may be one of the following:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; interleukin-2; IL-2; IL-2 mutein; HIV; cancer; renal carcinoma; malignant melanoma; autoimmune disease; infectious disease; immune deficiency; SCID; tuberculosis; adjuvant; cancer vaccine;
                                                                                             New polypeptide comprising a human interleukin-2 (IL-2) mutein useful for treating diseases such as HIV and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Resonances between coding and non-coding regions were measured for the native human IL-2 gene in plasmid pT911 (see AA055630) and a synthetic IL-2 gene (AA055639) in which alternative, degenerate codons were used in order to introduce additional restriction sites. It was found that the degenerate changes greatly upset the inatural order between coding and non-coding regions; as a result, the amount of protein expressed by the degenerate gene is likely to be adversely affected. The inventors have proposed an "optimised" il. 2 gene with the aim of increasing the amount of protein expressed by the gene with the sam of sequence is also described as

The plasmid may be used to transform an expression system giving a fusion protein which may be used as a diagnostic agent for bovine tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                   The sequence corresponds to the first 58 amino acid residues of human IL-2. It forms part of a fusion protein, linked to a heterologous protein. The heterologus protein is preferably gag 24 or a fragment of gp 41 of HIV-1 or 1 t is a fragment of gp 36 of HIV-2. Such fusion proteins can be used to detect antibodies to these proteins. See also AAQ10899-Q10903.
                                                           Method for expressing heterologous proteins – as fusion protein, using vector contg. stabilising sequence
                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                               Pro-insulin is produced by treating recombinant precursor protein with a mercaptan to provide 2-10 SH residues per Cys residue, in presence of a chaotropic agent and in aq. medium of pH 10-11, retaing the prod. with 3-50 g hydrophobic adsorber resin per 1 aq. medium of pH 4-7, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin and correctly bonded Cys bridges. Compared with known methods in the involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overall losses during purification are reduced, i.e. the process is quicker and gives better yields. Sequences of insulin chain A, B and C are given in AAR68895-97. Sequences of pro-insulin 1-4 are given in AAR68898-901.
                                                                                         Prodn. of pro-insulin with correct disulphide bridges - by treating recombinant precursor protein with mercaptan in alkali and in presence of chaotropic agent, then isolation on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the targetted hetero-association of recombinant proteins. The IL-2 is segmented between His79 and Lys80 to form ALPHA (AAR9543) and BETA (AAR95434) segments encoded by MroI-AscI-HindIII gene cassettes (AAT15267 and AAT15268, respectively). The device combines the low immunogenicity of the plasmattic protein with a preferable effector segmental cysteine bridge (Cys58-Cys105) after assembly. The combination of lor more antibody fragments against tumour antigens with additional cytokines, e.g. IL-6 or IL-12, targets the multi-cytokine complex directly to the tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                           Targetted hetero-association of recombinant proteins to multi-functional complexes - useful for therapeutic and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human interleukin-2 (IL-2) can be used as an assembly device for

                                                                                                                                                                                      The present sequence is that of a fusion protein, produced in E.coli which contains an example of a proinsulin molecule corresp.

to the general formula R2-R1-(B2-B29)-Y-X-GIY-(A2-A20)-R3 (II). In formula (II), X = Lys, Arg or a peptide of 2-35 amino acids contg. Lys or Arg at the N- and C-termini; Y = a natural amino acid; R1-phe or a bond; R2 = H, Arg, Lys, a peptide of 2-45 amino acids contg. Arg or Lys at the N- and C-termini; R3 = a natural amino acids acid; (A2-A20) and (B2-B29) are the insulin A- and B-chain sequences from human or other insulin. The proinsulin molecule, released by reyangen bromide, is reacted with mercaptan at a ratio of 2-10 SH residues of mercaptan per Cys residue of proinsulin. The reaction
                                                                            Isolation of insulin that is correctly post-translationally processed - by reacting pro:Insulin with a mercaptan in the presence of a chaotropic agent and purificn. after absorption to hydrophobic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                   takes place in the presence of a chaotropic auxiliary agent at 19H 10-11 and results in proinsulin with correctly linked cystine bridges. Reaction with trypsin and opt. carboxypeptidase B yields correctly folded insulin. The insulin is isolated by absortion on a hydrophobic resin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunotherapy; lymphokine; interleukin-2; thymocyte mitogenesis

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A; Molecule type: protein
A; Residues: 21-153 <ROB>
A; Residues: 21-153 <ROB>
A; Note: disulfide bonds and carbohydrate binding site were determined
A; Note: heterogeneity in Jurkat-derived IL-2 is primarily due to differences in glycosyl
n in lacking 21-Ala (FT-IL2-A and FT-IL2-B)

IMMUNOI. 155:3946-3954(1995).
FUNCTION: PRODUCED BY T-CELLS IN RESPONSE TO ANTIGENIC OR MITGENIC STIMULATION, THIS PROTEIN IS REQUIRED FOR T-CELL PROLIFERATION AND OTHER ACTIVITIES CRUCIAL TO REGULATION OF THE IMMUNE RESPONSE. CAN STIMULATE B CELLS, MONOCYTES, LYMPHOKINE-ACTIVATED KILLER CELLS, NATURAL KILLER CELLS, AND GLIOMA CELLS. SUBCELLULAR LOCATION: Secreted.
SUBCELLULAR: DELONGS TO THE IL-2 FAMILY.

Sequence 1, Application US/10142120
Patent No. US20020164302A1
Patent No. US20020164302A1
REGENERAL INFORMATION:
APPLICANT: Epstein, Alan L.
TITLE OF INVENTION: VASOPERMEABILITY ENHANCING PEPTIDE FRAGMENT OF HUMAN INTERLEUKIN-FILE REFERENCE: 1920-325D2-09801297
CURRENT PAPLICATION NUMBER: US/10/142,120
CURRENT FILING DATE: 1999-11-18
PRIOR APPLICATION NUMBER: 09/443,061
PRIOR APPLICATION NUMBER: 09/806,121
PRIOR FILING DATE: 1996-12-23
NUMBER OF SEQ ID NOS: 2
SOFTWARE: PATENTIN VERSION 3.1
SEQ ID NO 1
LENGTH: 37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
